## overcommit-accounting..txt

The Linux kernel supports the following overcommit handling modes

- Heuristic overcommit handling. Obvious overcommits of address space are refused. Used for a typical system. It ensures a seriously wild allocation fails while allowing overcommit to reduce swap usage. root is allowed to allocate slighly more memory in this mode. This is the default.
- 1 Always overcommit. Appropriate for some scientific applications.
- Don't overcommit. The total address space commit for the system is not permitted to exceed swap + a configurable percentage (default is 50) of physical RAM. Depending on the percentage you use, in most situations this means a process will not be killed while accessing pages but will receive errors on memory allocation as appropriate.

The overcommit policy is set via the sysctl `vm. overcommit\_memory'.

The overcommit percentage is set via `vm. overcommit\_ratio'.

The current overcommit limit and amount committed are viewable in /proc/meminfo as CommitLimit and Committed\_AS respectively.

## Gotchas

\_\_\_\_\_

The C language stack growth does an implicit mremap. If you want absolute guarantees and run close to the edge you MUST mmap your stack for the largest size you think you will need. For typical stack usage this does not matter much but it's a corner case if you really really care

In mode 2 the MAP\_NORESERVE flag is ignored.

## How It Works

\_\_\_\_\_

The overcommit is based on the following rules

For a file backed map

SHARED or READ-only - 0 cost (the file is the map not swap)

PRIVATE WRITABLE - size of mapping per instance

For an anonymous or /dev/zero map

SHARED - size of mapping

PRIVATE READ-only - 0 cost (but of little use)
PRIVATE WRITABLE - size of mapping per instance

Additional accounting

Pages made writable copies by mmap shmfs memory drawn from the same pool

## $overcommit-accounting..\,txt$

	over commit accounter.
Status	
O	We account mmap memory mappings
O	We account mprotect changes in commit
O	We account mremap changes in size
O	We account brk
O	We account munmap
O	We report the commit status in /proc
O	Account and check on fork
O	Review stack handling/building on exec
O	SHMfs accounting
O	Implement actual limit enforcement
	•
To Do	
0	Account ptrace pages (this is hard)
