What: /sys/dev
Date: April 2008
KernelVersion: 2.6.26
Contact: Dan Williams <dan.j.williams@intel.com>
Description: The /sys/dev tree provides a method to look up the sysfs
                path for a device using the information returned from
                stat(2). There are two directories, 'block' and 'char',
                beneath /sys/dev containing symbolic links with names of
                the form "<major>:<minor>". These links point to the
                corresponding sysfs path for the given device.

                Example:
                $ readlink /sys/dev/block/8:32
                ../../block/sdc

                Entries in /sys/dev/char and /sys/dev/block will be
                dynamically created and destroyed as devices enter and
                leave the system.
