* Global Utilities Block

The global utilities block controls power management, I/O device
enabling, power-on-reset configuration monitoring, general-purpose
I/O signal configuration, alternate function selection for multiplexed
signals, and clock control.

Required properties:

 - compatible : Should define the compatible device type for
   global-utilities.
 - reg : Offset and length of the register set for the device.

Recommended properties:

 - fsl,has-rstcr : Indicates that the global utilities register set
   contains a functioning "reset control register" (i.e. the board
   is wired to reset upon setting the HRESET_REQ bit in this register).

Example:
        global-utilities@e0000 {   /* global utilities block */
                compatible = "fsl,mpc8548-guts";
                reg = <e0000 1000>;
                fsl,has-rstcr;
        };
